

Experiment Report: Checkout Button Colour Test

Generated 10 Jun 2026 19:15

Recommendation: CONTINUE TESTING

Confidence: LOW | Risk: HIGH

- Results are inconclusive - insufficient evidence either way
- Extend experiment or increase sample size
- Expected value of shipping: \$18.37/day vs keeping control: \$0.00/day

Experiment design

Field	Value
Hypothesis	Changing the CTA button from grey to green increases conversion rate
Variants	Control (Grey Button) vs Treatment (Green Button)
Sample size	10,000 control / 10,000 treatment
Duration	14 days
Significance level	alpha = 0.05

Frequentist results

Metric	Control	Treatment	Lift
Conversion rate	5.01%	5.09%	+1.60% rel.
95% CI	[4.60%, 5.46%]	[4.68%, 5.54%]	
Revenue / user	\$2.532	\$2.543	+0.43% rel.

Two-proportion z-test: $z = 0.258$, $p = 0.7961$ (not significant at $\alpha = 0.05$). Welch t-test (revenue/user): $t = 0.069$, $p = 0.9449$, Cohen's $d = 0.0010$. Power: 35.5% for a 10% MDE (required $n = 31,152$ /group).

Bayesian results

Metric	Value
P(treatment > control)	60.2%
Expected relative uplift	+1.59%
Expected loss if shipping treatment	0.0878 pp
Expected loss if keeping control	0.1678 pp
Control 95% credible interval	[4.60%, 5.46%]
Treatment 95% credible interval	[4.68%, 5.54%]

Prior: Beta(1, 1)

Business impact

Assumptions: 5,000 daily visitors, 50% of traffic affected, \$45.00 revenue per conversion.

Metric	Value
Daily conversion lift	+2.0 conversions/day

Daily revenue lift	\$+90.00/day
Annual revenue lift (point estimate)	\$+32,850
Annual range (treatment CI)	\$-137,068 to \$216,931
EV of shipping vs status quo	\$+18.37/day

Scenario analysis

Scenario	Assumed lift	Daily revenue impact	Annual revenue impact	Probability	Recommendatio
Null (no effect)	+0.000%	\$0.00	\$0	5%	Do not ship
Pessimistic	-0.334%	\$-375.53	\$-137,068	10%	Do not ship
Base case	+0.080%	\$90.00	\$32,850	65%	Continue testing
Optimistic	+0.528%	\$594.33	\$216,931	20%	Ship treatment

Caveats

- Annualised figures extrapolate a short test window; seasonality and novelty effects may erode the lift.
- Revenue impact assumes the conversion lift is the only effect (no change in average order value).
- Scenario probabilities are illustrative weights, not posterior probabilities.
